## ► 概述 Description

■ ■ 接近开关是把要控制的物理量、化学量转为电量形式的开关量信号的传感器，它由振荡器起振后在开关的感应区上产生一个交变磁场，当阻尼物体（如金属）接近感应区时，在阻尼体内产生涡流，吸收了振荡能量，至使整形放大转换二进制的开关，它具有体积小，频率响应快，电压范围宽，重复精度高，抗干扰性能强，使用寿命长，工作稳定可靠，广泛应用于冶金、化工、机械、轻工、矿业、烟草、军工、纺织、自动化流水线等，也适用于机床限位、计数测速、液面、保护等各种控制，具有防水、耐腐蚀、耐振等特点。

■ ■ The proximity switch is a sensor of switch signal that changes the physical and chemical quantity into the power quantity. It produces an alternating magnetic field in the inductive area of the switch by the oscillator after the vibration. When the damper (such as metal) gets close to the inductive area, there will be eddy currents in the damper, which absorbs the oscillation energy, so that it becomes an enlarged switch with binary system. It is characterized by small volume, fast frequency response, wide voltage range, high repetition accuracy, strong resistance to interference, long use life, and stable and reliable operation. It is widely used in metallurgy, chemical, machinery, light industry, mining, tobacco, military industry, textile, and automatic production lines. It is also applicable to the machine tool's position limitation, speed calculating, liquid surface protection and other controls, featuring waterproof-ness and strong resistance to corrosion and vibration.
